Abstract

Sign Up:

One or two sentences providing a **basic introduction** to the field, comprehensible to a scientist in any discipline.

Two to three sentences of **more detailed background**, comprehensible to scientists in related disciplines.

One sentence clearly stating the **general problem** being addressed by this particular study.

One sentence summarizing the main result (with the words “**here we show**” or their equivalent).

Two or three sentences explaining what the **main result** reveals in direct comparison to what was thought to be the case previously, or how the main result adds to previous knowledge.

One or two sentences to put the results into a more **general context**.

Two or three sentences to provide a **broader perspective**, readily comprehensible to a scientist in any discipline.

Keywords: race, ethnicity, mental health disparities, depression, substance use

Racial/Ethnic Disparities in Mental Health

Introduction

Despite advances in access to health services, quality of care, and overall gains in life expectancy, racial/ethnic disparities in health in the United States (U.S.) remains to disproportionately affect the lives of racial/ethnic minority groups. D. R. Williams and Mohammed (2009) refer to the finding of Levine et al. (2016) that approximately 100,000 African Americans who would not die if there were no racial disparities die prematurely every year. Unfortunately, in the mental health arena, racial/ethnic disparities are no exception.

Even though the burden and impact of physical diseases on different racial/ethnic subgroups have been far more studied than the impact and burden of mental health disorders, we know that globally, depression is the leading cause of disability and loss of productivity, and that its direst outcome, death via suicide, is on the rise (WHO, 2018 (accessed December 4, 2018)). It is well-known that mental health services are costly and thus a high proportion of the American population cannot afford them.

Given that depression is usually screened and treated first in primary care settings, access to medical care is the first barrier to treatment that racial/ethnic minority groups face (D. R. Williams & Mohammed, 2009). From there, racial/ethnic minority groups experience barriers such as low detection rate of mental health disorders in comparison to Whites (Borowsky et al., 2000); language barriers for non-English speakers (Fiscella, Franks, Doescher, & Saver, 2002); use of screening measures not translated or validated for racial/ethnic minority groups; issues of trust related but not limited to underrepresentation of racial/ethnic minorities among mental health professionals, and cultural differences in understanding and treating mental health disorders (Miranda & Cooper, 2004). Overall, these and other barriers affect the access and quality of treatment racial/ethnic minority groups receive in respect to their mental health.

—Maria will do drug use onset and health disparities (short 1 paragraph) — use of substances as an alternative treatment for depression that people may recur to—

In the present study, we aim to explore some of the health disparities among different racial/ethnic groups using a nationally representative sample, the National Health and Nutrition Examination Survey (NHANES) 2015 – 2016.

NOTE: The WHO reference is not working well. Is showing the access date.

14609 The present study gathered data from the Center for Disease Control and
 14610 Prevention's (CDC) National Health and Nutrition Examination Survey (NHANES). Using
 14611 the 2015-2016 NHANES dataset, we were able to investigate levels of depression, drug use,
 14612 whether or not individuals had insurance, if they have sought out mental health services,
 14613 based on racial/ethnic group. Data from 4,843 participants was gathered, with the average
 14614 age of participants being ($SD =$) years old. The majority of participants were women (`rd1_female`), Hispanic (), and made \$100,000 or more (). Table 1 presents the breakdown
 14615 of the sample based on race/ethnicity.

14618 Measures

14619 sign up:

14620 To assess depression symptoms, we used the depression module from the full Patient
 14621 Health Questionnaire (Kroenke, Spitzer, & Williams, 2001: PHQ). The PHQ-9 is a 9-item,

self-report screening instrument. Participants are prompted by the stem “Over the last 2 weeks, how often have you been bothered by any of the following problems?”. Sample questions include “Feeling down, depressed, or hopeless?” and “Thoughts that you would be better off dead or of hurting yourself in some way”. The module uses a 4-point scale that goes from 0 (not at all) to 3 (nearly every day). “Refuse to answer” and “Don’t know” options are also included. A single score is derived from the depression module by summing the responses for the 9 items. Scores can range from 0 to 27; higher scores reflect more severe depressive symptoms.

Insurance coverage was assessed with the item “Are you covered by health insurance or some other kind of health care plan?” from the NHANES Health Insurance Questionnaire. Response choices included “Yes”. “No”, “Refused”, and “Don’t know”.

Usage of mental health services was assessed with the item “During the past 12 months, have you seen or talked to a mental health professional such as a psychologist, psychiatrist, psychiatric nurse or clinical social worker about your health?” from the NHANES Hospital Utilization and Access to Care questionnaire. Response choices included “Yes”. “No”, “Refused”, and “Don’t know”.

14648 **Results**

14649 The average depression score and average age of first opioid and stimulant use for
14650 each racial/ethnic group is presented in Table 2. Briefly, White individuals had the earliest
14651 age of first use for opioids (21.60 years). Interestingly, Asian individuals had the lowest
14652 average depression score (3.01) and started using both opioids and stimulants later than all
14653 other groups (mean age 27.86, 21.73 years respectively). Individuals who reported another
14654 race or multiracial reported the earliest age of first use for stimulants (18.93 years) and
14655 highest reported depression score (3.47).

14656 **Disparities in opioid and stimulant use**

14657 In our sample, 215 participants reported either opioid or stimulant use. To explore
14658 racial/ethnic disparities in reported use, we plotted the number of individuals who reported
14659 using opioids and/or stimulants based on their racial category. As shown in Figure 1, more
14660 Hispanic participants reported opioid and stimulant use, whereas Asian participants had
14661 the lowest reported frequency of use for both substances. To further explore disparities in
14662 substance use, we visualized the age of first use by ethnicity (see Figure 2). This plot shows
14663 that across both substance types Hispanic individuals have the most variability in their age
14664 of first use. Additionally, Asian participants have much more variability in their age of first
14665 opioid use compared to stimulants. This observation is slightly observed among Black and
14666 White individuals. Overall, it seems that the majority of participants reported their age of
14667 first use to be between ages 15-25 for both substance types. However, it is more
14668 pronounced for reported stimulant use.

14669 Since depression and substance are strongly linked in the literature, we also produced
14670 a plot to explore racial disparities in average depression scores by substance type. As you

can see in Figure 3, Asian individuals that reported stimulant use had the highest reported average depression score compared to all other groups. For opioids, White participants had the highest reported depression score. To further explore the relation between age of first substance use and depression, we graphed age of first use by the total depression score and faceted by substance type. Then, we overlaid a best fit linear regression onto the graph according to racial groups (see Figure 4). Interestingly, the plot suggests that there is a positive association between age of first opioid use and depression for Black individuals and a negative association for all other racial groups. Additionally, we observed a positive relationship between age of first stimulant use and depression for all racial groups, however the slope of the relationship was more robust for Asian individuals.
